The theme permeating this book on assessment centers is "continuity and change", describing what has remained the same and what has changed in the 50-year history of the assessment center method. One of the important changes explored is the evolution of the goals of assessment center programs and the ways in which assessment centers and their component parts have been used. *Assessment Centers in Human Resource Management* clearly differentiates between assessment centers used for prediction, diagnoses, and development. In addition, this book explores: assessment centers and human resource management; court cases involving assessment centers; innovations in assessment center operations; cross-cultural considerations including diversity of the workforce; and assessor training. The target audience for the text includes students who are learning about assessment centers, practitioners including human resource managers and consultants who may be considering the implementation of assessment centers, and academicians who are researching the method and wish to understand current issues.

This book arrives at just the right time to facilitate understanding of performance-based fire risk assessment in buildings – an integral part of the global shift in policy away from traditional prescriptive codes. Yung, an internationally recognized expert on the subject of fire risk assessment, introduces the basic principles and techniques that help the reader to understand the various methodologies that are currently in place or being proposed by different organisations. Through his illustration of basic principles and techniques he enables the reader to conduct their own fire risk assessments. He demonstrates how the probabilities of fire scenarios are assessed based on the probabilities of success and failure of fire protection measures that are in place. He also shows how the consequences of fire scenarios are assessed based on the intensity and speed of fire and smoke spread, the probability and speed of occupant response and evacuation, and the effectiveness and speed of fire department response and rescue efforts. Yung's clear and practical approach to this highly topical subject enables the reader to integrate the various tools available into a quantitative framework that can be used for decision making. He brings an invaluable resource to all those involved in fire engineering and risk assessment, including students, academics, building designers, fire protection engineers, structural engineers, regulators and risk analysts.
